

REKOLT Planters' Cooperative Produce Tracker

Objective 5 – the design as built

This is the UML class diagram updated to match what was actually built for Objective 5, superseding the class diagram in design-v1.pdf. The overall shape of the design is unchanged from the paper design: the same classes, the same two capability interfaces, and the same relationships. Four small differences between the paper design and the build are logged, with reasons, in docs/design/change-log.md – in summary: Produce's label field is clarified to hold the specific commodity name rather than the category; Produce's constructor is protected rather than public, since Produce is abstract; SeasonStore's weeklyGrid() was not built as its own method, since the weekly grid still depends on Main's own produce-catalog column order; and SeasonStore and Member expose a couple of extra read-only getters so Main can iterate the season's data for on-screen reporting.
